

An EMCOR Industrial Services Company

**Why Us?** REPCON offers combined service offerings to reduce cost for planning and execution during any maintenance or construction event. In addition to improved communication, operational efficiency, and organizational effectiveness, sourcing specialized expertise together improves project synergies impacting all other work activities.

Historical project data reflects that schedule adherence suffers the greatest impact from critical path welding and/or piping system installation and repair. Combining the mechanical services with a proven specialty welding service provider improves goal attainment in all key performance areas.

Additional challenges have been experienced through proper alignment for capital projects executed in conjunction with planned outages. We understand and successfully execute work in capital construction, planned turnarounds, and the simultaneous performance of the combination within both work environments.

## Turnaround Welding Services /TWS

We deliver the right fusion. We provide optimum solutions for welding and piping systems through our on-site or off-site fabrication capabilities. We are positioned to expedite work activity and

project completion when piping systems are received that were fabricated prior to field changes or out of tolerance, and with existing system discoveries requiring repair or replacement. We are qualified to perform ASME (“S” & “U”) and NBIC (“R”) work activities. We perform work associated with achieving the weld, including blinding and rigging to reduce bottlenecks and improve operational efficiency. We weld all types of metals and utilize GTAW, SMAW (Stick Rod), and GMAW weld processes.

## Construction

A full range of construction services built from the ground up. We are sourced in alignment with the contracting strategy established for each project. We perform our work through EPC providers and

directly with industrial owners in both general contractor and project management roles, responsible for all work activity in addition to our direct-hire service offerings. We direct hire for each phase including civil, steel erection, fixed equipment, and piping systems. We perform fabrication, assembly, and installation work activities.

## Turnaround Mechanical Services

We maintain and repair all fixed equipment within industrial process units. The success of scheduled turnarounds and outages requires more than providing equipment, materials, and labor to support an identified and often evolving work scope. The organization, operation, and control systems we offer provide agility to incorporate potential discovery work into the existing plan, changing logistical demands, and the weather. To achieve

optimum results, turnaround participants must utilize proven methods for planning and executing the work while incorporating new ideas that enhance the overall event. Our turnaround teams are equipped with modern planning skills and the latest management techniques in order to effectively master the complexities and challenges inherent during this type of event.

## Off-site Fabrication Services

Shop fabricated pipe is the most cost-effective solution for piping systems. We have established our fabrication facilities logistically for rapid response and delivery to major industries located near the Gulf Coast – Gonzales, LA, Houston, TX, and Corpus Christi, TX. While our primary services are for pipe fabrication, we also modify and repair

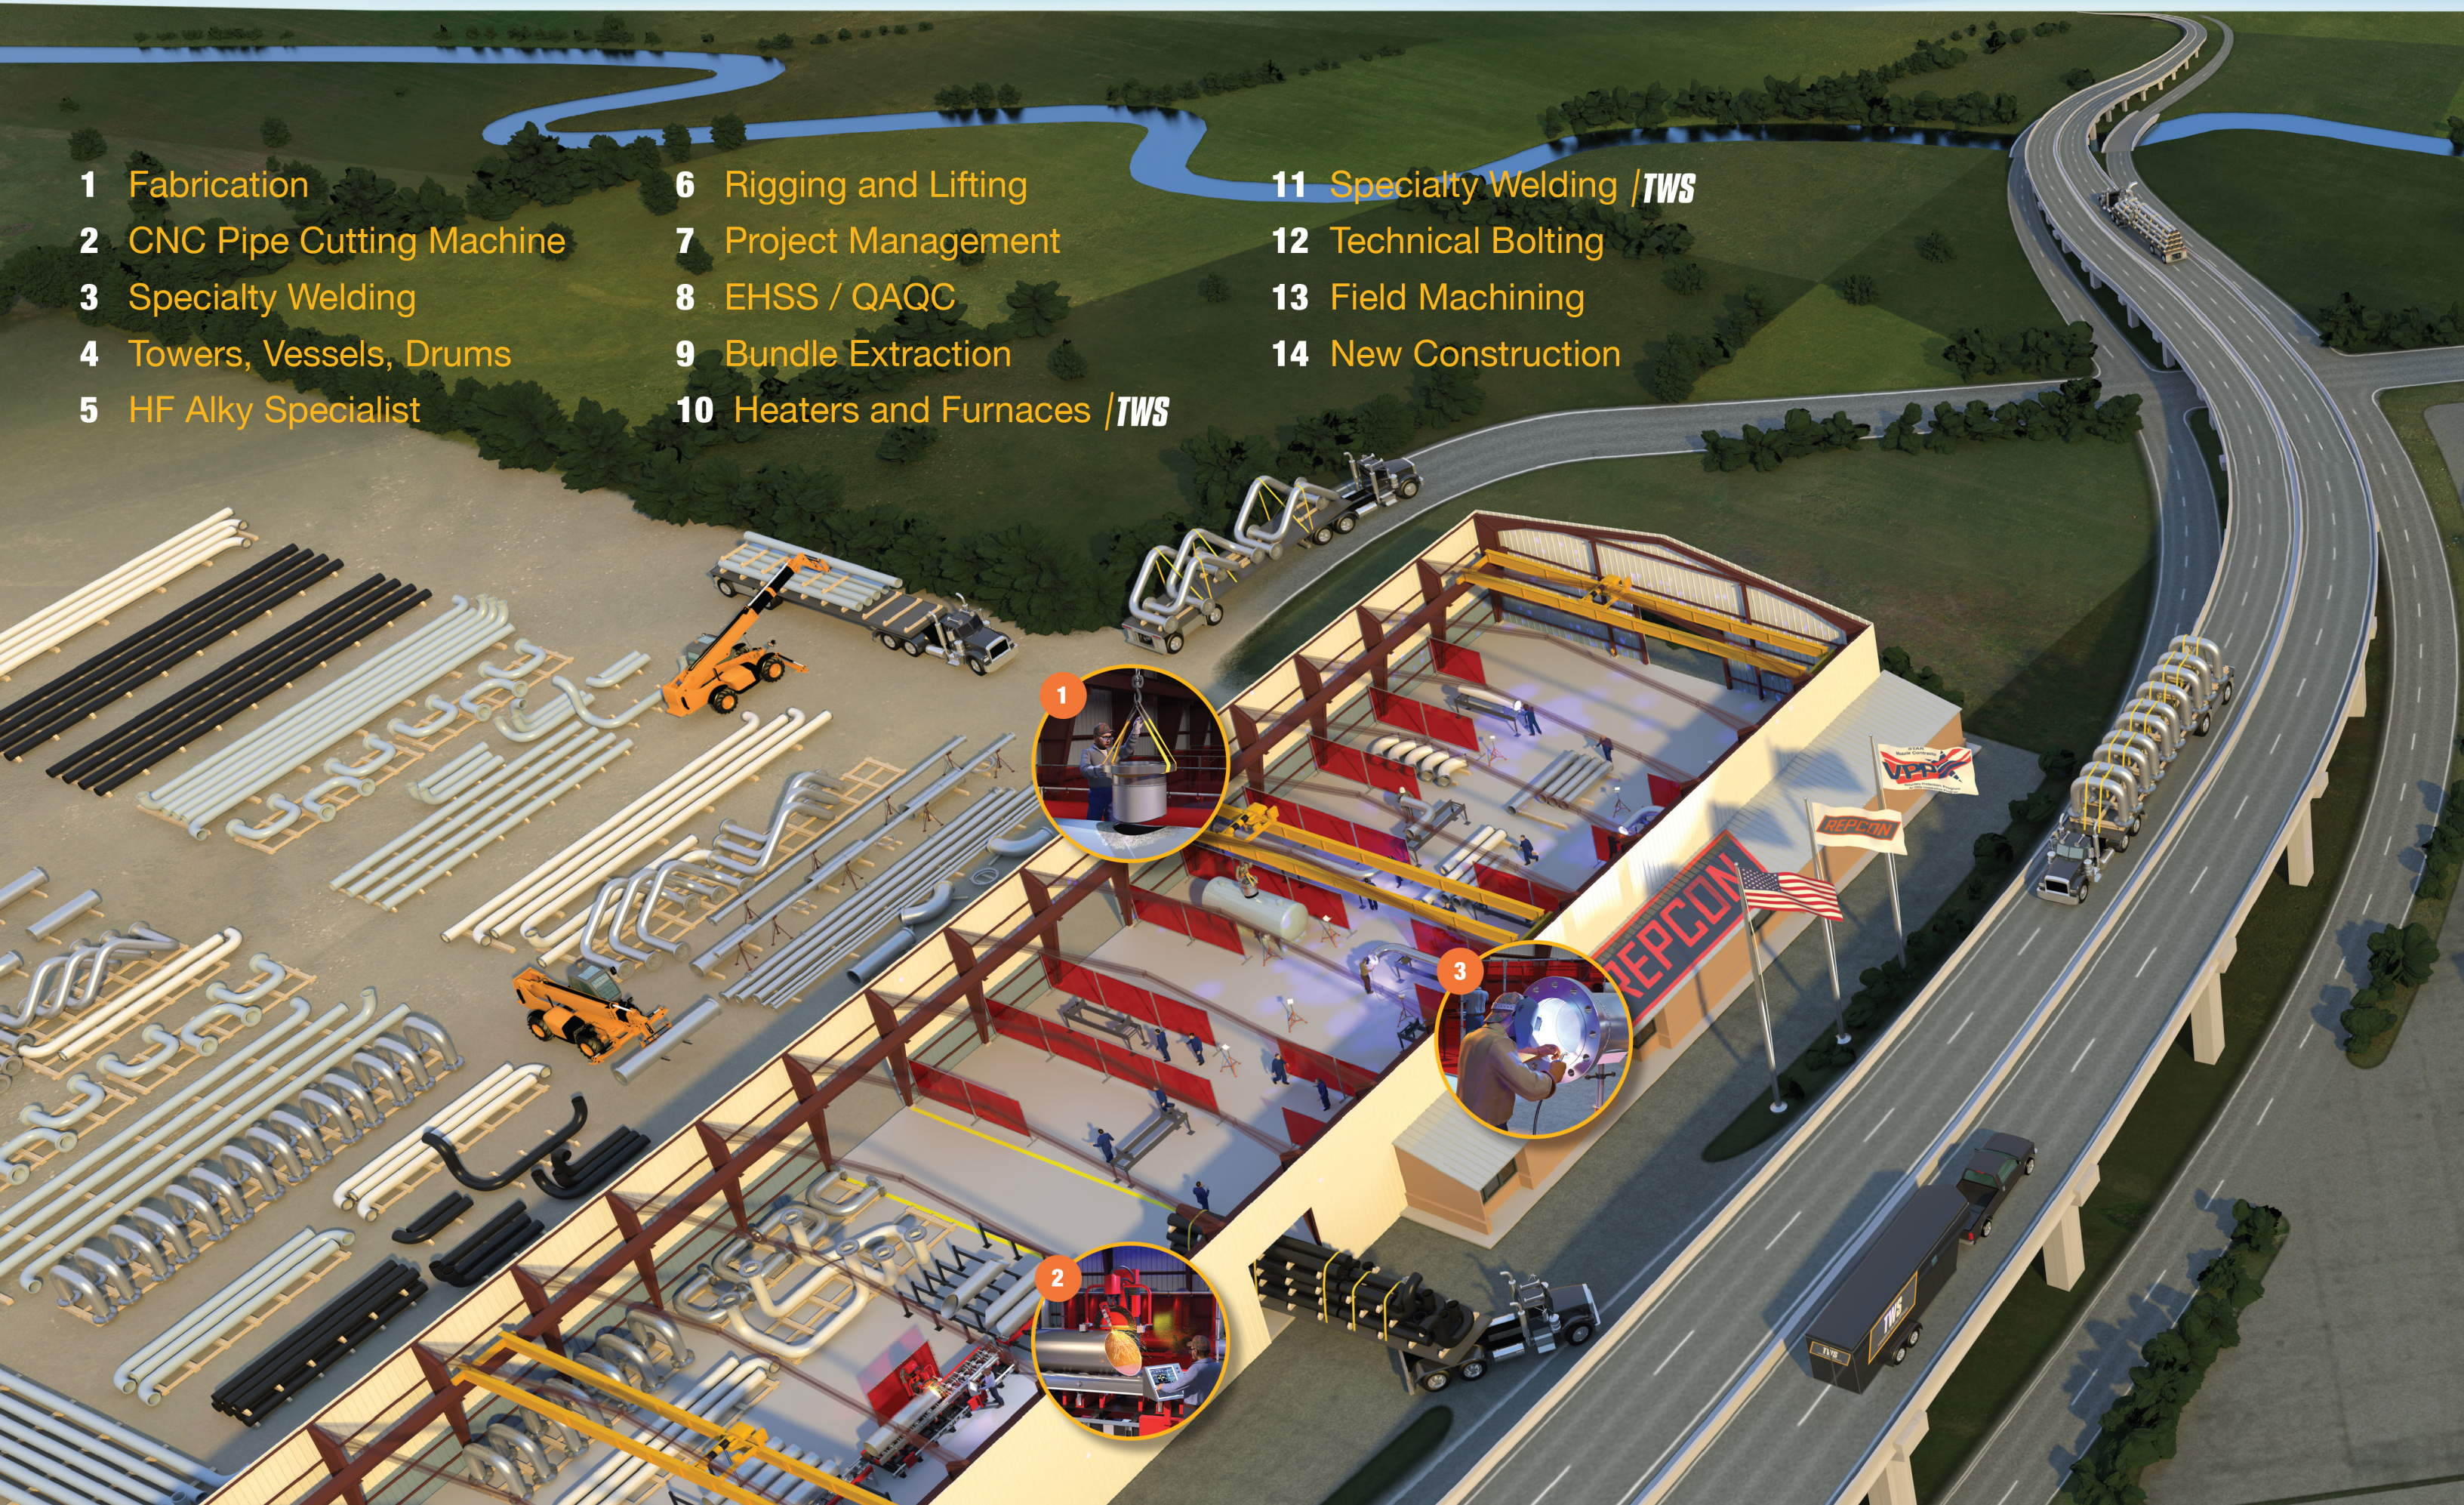

small to mid-size code vessels. In addition to weld processes listed previously, we also perform Flux Core Arc Welding (FCAW/FCA) within our shop controlled environments. We utilize semi-automatic, multi-process, and high frequency alloy welding machines. We incorporate positioners/headstocks, pipe turn rolls, and Vernon Five Axis CNC Cutting machines for improved operational efficiency and productivity while maintaining the highest quality of our delivered piping spools.

We safely deliver timely, predictable, innovative construction and maintenance solutions that help optimize cost savings. Our work teams are professional, qualified, and experienced at working together to achieve the highest quality and productivity during each work activity. We are experts in servicing industrial processes for downstream refining, petrochemical, chemical, fertilizer, and gas processing facilities within North America. Our clients realize the greatest value when engaging us early to assist with strategic planning, constructability reviews, sourcing long-lead items, and identifying optimum sourcing strategies for achieving project goals. **Why not?**
